Unblock porn proxy

Unblock-US is not a typical VPN service. Instead, it routes your DNS queries through its servers, changing your location based on the sites you visit. This allows you to access any type of blocked content, without any buffering or throttling.If such a platform won't work for you and you're looking for a full VPN with all its advantages, then we strongly advise you to consider one of the best VPN solutions.PriceThere are two subscription plans on the table: monthly and annual. The former will set you back by \$4.99/month, while the annual includes a \$10 discount and costs \$49.90/year (equal to \$4.16/month).This is a bit expensive considering we are not talking about a full VPN service here - and Unblock-US can only be connected on one device at a time.If you don't think Unblock-US is the right choice for you, the provider offers a one-week free trial, no credit card required. Full refunds are also issued to users who cancel their annual subscription within the first thirty days after the purchase.A full VPN service can provide all the features Unblock-US doesn't, especially a top-of-the-range offering like ExpressVPN, NordVPN, CyberGhost or Surfshark.StreamingUnblock-US can provide access to the likes of Netflix, Hulu, BBC iPlayer, Amazon Prime Video, and other streaming services that might be unavailable in certain regions due to geographical restrictions.(Image credit: Future)About the companyUnblock-US is owned by the company NetProtect Ltd, headquartered in Nicosia, Cyprus. It operates with the help of 100 servers in 17 countries.To provide you with access to all sorts of content on the internet privately, Unblock-US uses its SmartVPN. Unlike its SmartDNS technology, where it deploys a proxy to conceal the source of your IP address to the domains that request it, SmartVPN adds a layer of security to your connection.However, it doesn't encrypt user data, but "simply seals the contents of your data for transport so that the information within cannot be tampered with. That means no more snooping on your DNS traffic by your cellular carrier, and no more spying on behalf of Google".We were surprised to see that the provider's website didn't have an HTTPS certificate and it asked us to disable our ad-blocker, which isn't very encouraging in terms of security. That said, at least its sign-up page, where you leave your personal information, is secure and protected by Trustwave's Trusted Commerce program.The company claims in its Privacy Policy that it doesn't collect or log any traffic or use of its services, nor does it store "any of your data that passes through our servers, and we never manipulate the content you access." It adds that it doesn't "provide information that we do have unless we are legally required to".In other words, some data does seem to be collected and if an authority asks it to hand over any information about you, it will comply. But since Unblock-US states it doesn't collect any traffic data, sensitive information about your online activities should be safe.Unfortunately, we have no choice but to trust its word, because an external expert has not yet been brought in to verify the service's no-logging claims.SupportUnblock-US can be configured on all major computers and mobile devices, as well as various other devices, including Apple TV, PlayStation 4, Xbox One, Wii, Amazon Fire TV, routers, and so on.However, there are no native apps for its SmartVPN service, so you'll have to make do with third-party software like OpenVPN or Tunnelblick, which can be a bit confusing for a beginner.Setup guides are available on the website and they're very detailed. Besides the setup walkthroughs, Unblock-US' website also includes a support center with useful articles on various topics, such as billing, sites and channels, announcements, etc. If the website can't help with your problem, then you can contact human customer support via web form or phone.(Image credit: Future)Speed and experienceWe tested the download speeds of the provider's service and were quite pleased. Since Unblock-US doesn't route your traffic through any servers but just assigns you a new IP address, this means there were no losses in download or upload speeds during our testing. However, picking a server manually is impossible as the provider chooses the server closest to you automatically.Unfortunately, there are no native clients so if you're not used to such a system, you might feel overwhelmed and if you run into any problems, reading the log files might be overly complicated and confusing. Also, some may not be comfortable with tampering with their adapter options, which Unblock-US's DNS service requires.VerdictUnblock-US has some strong unblocking capabilities, but that's as far as it goes. It's not a full VPN platform, so you shouldn't expect any fancy privacy features and options, thousands of servers, nor full identity protection, as you would with the industry's greatest performers such as ExpressVPN.It's great that Unblock-US offers a free trial and 30-day money-back guarantee but the lack of native apps makes it less appealing to beginners. By Greyson Ferguson While at school or work, it is a common practice to have a proxy blocker active. A proxy blocker will essentially block specific sites from use by those on the server. Commonly blocked sites include Facebook, YouTube, email providers and instant-messaging services. But by surfing the web anonymously, you can navigate around the blocks. Log onto the web browser. Select one of the proxy blocker links in Resources. These sites will allow you to surf the web anonymously. However, there are certain websites that will not allow you access because of this. Type in the web address of the site you want to go to and press "Enter." Close out the advertisement if one appears. Also, the proxy blocker will occasionally take you to a third-party site initially. Click the "Back" button on your web browser and you will be taken back to the website you wanted to navigate to. By Joshua Phillips When you block a user on Tumblr, that user can no longer message you or view your blog. To block a user, you must manually enter a Tumblr user's name to your Ignored Users page; this presents a margin of error as you may accidentally ignore a user you didn't want to by misspelling a username. If you find that you've ignored a Tumblr user you had no intention of ignoring, you can unblock that user from your Ignored Users page. Click the "Account" icon at the top of the Tumblr homepage. This icon is in the shape of a gear. Click the "Ignored Users" button at the bottom of your Tumblr account page. Click the "Stop Ignoring" button next to each member you want to unblock. If you've blocked someone on Facebook but feel like it's time to reconnect, the social network makes it easy to bring them back into your world. Here's how to unblock someone on Facebook's desktop version and in its mobile app. Blocking someone on Facebook is more serious than unfriending, snoozing, or unfollowing them. When you block someone, it's as if you're invisible to each other on Facebook. AleksandarGeorgiev / Getty Images If you're using Facebook via a web browser on your desktop, here's what you'll need to do to unblock someone: Navigate to Facebook.com and select the account icon (upside-down triangle) from the top right. Select Settings & Privacy. Select Settings. From the menu on the left, select Blocking. In the Block Users section, you'll see the names of any users you've previously blocked. Find the person you want to unblock and select Unblock. Facebook will explain what will happen when you unblock this person. Select Confirm to unblock them. If you were previously Facebook friends, unblocking someone doesn't automatically make you friends again. You'll need to send a new friend request, and the request must be accepted, to become Facebook friends again. If you're using Facebook's iOS or Android mobile app, here's what you need to do to unblock someone: Open the Facebook app and tap Menu (three lines) from the bottom right. On an Android device, tap Menu (three lines) on the top right of the screen. Tap Settings & Privacy. Tap Settings. Scroll down to the Privacy section and tap Blocking. In the Blocked People section, you'll see the names of any users you've previously blocked. Find the person you want to unblock and select Unblock. Select Unblock to confirm. If you were previously Facebook friends, unblocking someone doesn't automatically make you friends again. You'll need to send a new friend request, and the request must be accepted, to become Facebook friends again. When you block a Facebook user, they can't communicate with you or see anything you post, and you won't see any of their posts or comments. The blocked user can't invite you to events, send a friend request, see your profile, or send you an instant message through Messenger. It will be as if you're invisible to each other on Facebook. A person doesn't have to be a Facebook friend to be blocked. Unblocking someone on Facebook makes you both visible to each other again on Facebook, but if you were previously Facebook friends, you won't automatically have your friend status restored until one of you sends a friend request, and the other accepts. If you've blocked someone on Facebook, they won't be notified. They may realize they're blocked if they try to search for your account because they won't be able to see your name in the search results. Or, they may notice that they're not seeing your posts. Thanks for letting us know! Tell us why! Skype lets you block a contact to prevent that person from calling you, sending you instant messages, and checking your online status. This feature offers a great way to get rid of spammers or other annoyances on the platform. Blocking is fast and easy—but so is unblocking. This guide applies to Skype version 8.55.0.141 and later. Follow the steps below to unblock a Skype contact. Once you unblock that person, they will likely see any missed messages or call logs that were sent while the block was in place. Select the More icon (the three dots) next to your name, then select Settings. Select Contacts. Select Blocked Contacts. Find the person you want to unblock, then select the Unblock button. The methods for unblocking a contact on Android and iOS are nearly identical to the method for PC and Mac. Tap your profile picture at the top of the Chats screen. Select Settings. Tap Contacts. Choose Blocked Contacts. Find the contact you want to unblock and tap the Unblock button to the right. Older versions of Skype for Android and iOS may not hide blocked contacts. Instead, these apps display a red Stop icon next to the name. To unblock these people, long-press their names, access their profile, and tap Unblock contact. Similarly, older versions of Skype on Android or iOS may not hide a blocked contact if their number is saved in the phone's app contacts. These contacts have On Skype as Name/Username listed underneath their entries in the Skype contact list. Thanks for letting us know! Tell us why! As you'll probably guess from the name, Unblock VPN is all about enabling access to blocked websites and internet services. Netflix isn't on the list, but the company claims it can unlock, BBC iPlayer, Hulu, Sky, ABC, Fox, Facebook, YouTube, Twitter, Skype, VoIP and more.The location list isn't as impressive, with a tiny 21 servers spread across just nine countries. Most are in the US and UK, with others in Canada, Germany, Sweden, Netherlands, Czech Republic, Slovakia, and Israel. P2P is supported on the Swedish server only. Hand-picked Aussie EOFY deals: these are TechRadar's favourite sales!That can't compare with top competition, so for instance NordVPN has servers in 59 countries, ExpressVPN in 94, HideMyAss! in 190+.Want to try Unblock VPN? Check out the website hereMaybe Unblock VPN will add more servers, soon, we thought? Then we checked Unblock VPN's Twitter feed, noticed the last tweet was in July 2017, and thought - okay, maybe they won't.Unblock VPN has clients for Windows and Mac only. There are plenty of setup tutorials for other platforms, though, including Android, iOS, Linux, and routers.Pricing isn't bad at \$4.99 billed monthly for a dynamic IP, \$9.99 for a dedicated IP (which may help you unblock more sites), falling to \$3.33 or \$8.33 if you pay for a year up front.Unblock VPN also offers a free 3-day trial. It's horribly restricted with a 5-minute connection time limit and a maximum of 20 connections a day, but it's enough to confirm that it unblocks a particular site, or maybe run a speed test, and it's more than you'll get with many providers.Unfortunately Unblock VPN does keep some logs on its users (Image credit: Unblock VPN)PrivacyUnblock VPN's terms of service and policies page is truly amazing, in the way it does almost nothing right. It's absurdly long at more than 6,000 words. It uses obscure legalese rather than clear English. It constantly refers to the 'legal order of the Czech Republic', something that we'd guess will be a total mystery to most potential customers. It's poorly organized, and leaves sections of up to 600 words in single blocks, without paragraph formatting, making it very difficult to read. And even if you fight through all that, it doesn't tell you everything you need to know.The company does provide a simple no-logging statement, claiming it "does not track the user's activities". But just as you're feeling reassured, it hits you with this: "The Provider is allowed to save server logs that are created or processed when ensuring the services provided by the Provider or when performing the Contract, for maximum of 3 calendar months from their acquisition. Server logs are not used for tracking of transmitted content or censoring of the User's Internet activities."What might these logs contain? We don't know, but the policy says the data it to help with the "potential identifying of illegal activities which are in contradiction to these Terms and Conditions." Whatever Unblock VPN is keeping, it's presumably enough to either find out something about what you're doing, or to link you to an internet action recorded by someone else (the IP address you're assigned and the time you were using it, for instance.) If you're just using the service to unblock a streaming site somewhere, this might not matter. If you're doing anything privacy-critical, it's going to be more of a problem.Unblock VPN's Windows client is quite basic with few additional settings and no kill switch (Image credit: Unblock VPN)AppsGetting started with Unblock VPN required handing over a little more information than we'd like – our name and country, as well as email address – but it was quick and easy, and our service password turned up moments later in an email.Unblock VPN presents its locations in a list as opposed to on a map (Image credit: Unblock VPN)The main Unblock VPN Windows client is, well, basic. You're able to choose countries and servers from a couple of lists, select a protocol (PPTP, L2TP and SSTP only, OpenVPN is only available with other software if you set it up manually), connect and disconnect with a click, and that's it. If you're hoping for a kill switch, DNS tweaks or anything else, then prepare for disappointment: there's nothing more, not even the most basic of settings.Checking the client's executables confirmed that this is a very minimal app with almost no functionality beyond creating and establishing a native Windows VPN connection. The entire installation takes up just 696Kb (HideMyAss! update tool is more than twice that size all on its own), and our version also hadn't been updated since May 2016.Unblock VPN doesn't have a kill switch, but it's still important to understand what happens if the tunnel drops. To simulate this, we connected using L2TP from the client, manually closed the connection, and watched closely.The results weren't bad: the client immediately spotted the failed connection, updated its interface and displayed a 'disconnected' notification as a warning.With no kill switch, connection traffic is still exposed until the user takes action, but the near-instant warning should limit the potential for harm. And although it may look underpowered, we prefer Unblock VPN's simple notification-based system to a kill switch which doesn't work (and beware; experience has shown us there's a lot of those.)Unblock VPN makes big claims about its unblocking abilities but the service only managed to give us access to US YouTube, BBC iPlayer and Amazon Prime Video (Image credit: Unblock VPN)PerformanceUnblock VPN is, well, all about unblocking the web, so we were keen to see if the service lived up to its name.According to our tests, the answer is 'not quite.' The service got us access to US YouTube, BBC iPlayer and Amazon Prime Video, but it failed with US Netflix and Disney+, and we'd expect a little better from a specialist unblocking service.The Windows client failed our privacy test, too, with DNSLeak.com DNSLeaktest.com and other sites revealing a DNS leak.Unblock VPN performed fairly well in our speed tests though (Image credit: Ookla)For all its other problems, Unblock VPN did at least deliver on speeds, with UK and US servers averaging more than 60Mbps, and Israel hitting 20-30Mbps; not bad at all.Final verdictUnblock VPN is surprisingly speedy, but that's not enough to compensate for the tiny network, the basic clients, the lack of features, the vague private policy, and, despite its name, the inability to unblock US Netflix. Take the free trial if you want to see if it can unblock something, but we think there are much better services around.We've also highlighted the best VPN
