## Transmission Media

- In a data transmission system, the transmission medium is the physical path between transmitter and receiver.
- Guided medium
  - Electromagnetic waves are guided along a solid medium.
- Unguided media
  - Wireless transmission occurs through the atmosphere, outer space, or water.
- The characteristics and quality of a data transmission are determined both by the medium and the signal.
  - For guided media, the medium itself is more important in determining the limitations of transmission.
  - For unguided media, the bandwidth of the signal produced by the transmitting antenna is more important. One key property of signals transmitted by antenna is **directionality**.
- Key concerns are data rate and distance: the greater the data rate and distance, the better.

## Types of Transmission Media
